Title: Perfect score: Sequence:

US-08-956-518A-90

CCCTATGGAG

Scoring table:

IDENTITY\_NUC

tabase :

311585 seqs, .125096042 residues

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; fig. 3; 15pp; English.

CC The gag (group specific antigen) proteins can be mass-
CC produced using Saccharomyces cerevisiae transformants. The
CC HTLV-1 gag gene or part of it can be prepared from an HTLV-1
CC pro virus using appropiate restriction enzymes. A large
CC amount of gag gene or part of it can be prepared by
CC amplifying in Escherichia coli a plasmid subcloned with the
CC HTLV-1 gag gene. DNA that encodes the gag protein is then
CC inserted into an expression vector. The proteins obtained
CC can be used in a diagnostic kit or as a HTLV-1 vaccine. See

                                                                                                                                                                                                                                                                                                                                        substrate-specific amino:peptidase enzymes API, AP2 and APX - used to remove amino-terminal amino acid residues from peptide(s) and protein(s).

Disclosure; 24pp; English.

Aminopeptidases are useful in extending the stability, solubility and biological activity and half-life, or in decreasing the immunogenicity. The vacuolar location presequence encoded by the gene is useful ni directing linked polypeptides through the vacuolar membrane.

Claim 4; fig 3; 73pp; English.
DNA encoding human common acute lymphoblastic leukaemia antigen (CALLA) (see corresp. p90393), and its fragments. Binds to anti-CALLA its (see corresp. p90393), and its fragment, to design a drug for use as a general analgesic. The DNA has functional endopeptidase activity.
Sequence 5524 BP; 1777 A; 1039 C; 1066 G; 1642 T;

PT Nucleic acid of Japanese encephalitis virus -
PT inmunisation against the virus
PT inmunisation against the virus
PT inmunisation against the virus
PS Claim 4; Fig 5/1-5/5; 52pp; English.
CC Substantially purified nucleic acid sequence of JEV but not to the nucleic acid sequence of yellow fever virus wherein the 10 bp sequence CC of DNA corresponding to the nucleic acid sequence of JEV but not to the nucleic acid sequence do not correspond to those found in 80297. Pref. the nucleic acid sequences do not correspond to those found in yellow fever virus, west encephalitis virus. The nucleic acid may be obtd. from the virus and inserted into a vector. Specific probes can be derived from this conserved into a vector. Specific probes can be derived from the puliphide and nucleic acid and antibodies produced to the polypeptide. The CC protein immunogens or with active vectors encoding such immunogens, encephalitis protective antiviral antibodies. The vaccination induces conserved to the disease caused by other flaviriuses.

CC sequence 4992 BP; 1332 A; 1166 C; 1390 G; 1100 U; 4 Others;

Claim 9; page 10; 17pp; English.
Claim 9; page 10; 17pp; English.
This sequence, and active fragments, is contained in an expression plasmid alongside a promoter and a gene encoding a protein of interest. The plasmid is propagated in host cells for the prodn. of erest. The plasmid is propagated in host cells for the prodn. of
                                                                                                                                                                                       PPSDB; R08119.
Endothelial cell adhesion mols.
                                                                                                  Disclosure; Fig 9 (A-C); 136pp; English.
The sequence was obtained from CDX PCDM8 clone 7.2 and f portion of the 7.2 insert subcloned into the sequencing CDX is a MILA, involved in ELAMI-mediated adhesion and i the (or an) ELAMI ligand. CDX is expressed in melanomas. See also Q06686-91.

CDX, a MILA involved in ELAM1-mediated adhesion, from pCDM8 clone
Endothelial cell-leucocyte adhesion molecule 1; ELAM1; CDX;
molecule involved in leucocyte adhesion; MILA; inflammation; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           erest. The plasmid is propagated in host cells for e.g. insulin, growth hormone, TNF and lymphokines ously replicating sequence has an affinity for a pie in and may be recovered by binding a mammalian cefragment/myc protein prod.

Disclosure; Fig 1, 129pp; English.
The production of CR2 ligands including a binding site (BS) is
possible by transforming a cellular host with a recombinant DNA
mol. contg. this sequence. The ligand pref. includes a fragment
encoded by a sequence indicated in the features, or the total
CDS. The ligand pref. contains only a single BS and has an
amino acid sequence <100 (pref. <20) residues in length.
The ligand may also comprise a plurality of the segment indicated
                                                                                                                                                                        1983
                                                                                                                                                                                                                                                                                                                                                                                   The compsn. can be administered vivo by Epstein-Barr Virus. C This sequence is a structural gene of the parasite and encodes p35 antigen. Total RNA was isolated from T.gondii grown in Hep-2 cells. The poly(A) fraction was separated and converted to cDNA. EcoRI adaptors were attached prior to ligation with lambda gtil EcoRI fragments, in vitro packaging and transfection into E.coli Y1090. The resulting gene bank was screened with hyper immune rabbit anti-C T.gondii serum. Of 88 seropositive clones, 8 were sequenced and 1 crossing these (F76-see q11914) was used as a probe to isolate p35. Partial sequences from this full-length clone, e.g. nucleotides 33-527, were inserted into vector pSEM to produce the immunogenic protein as a fusion protein with beta-Gal.

Claim 1; Pages 63-64; 65pp; English.

This sequence encodes the KGCEA2 peptide sequence. When the DNA is inserted into an expression vector and a host cell transformed with this the resultant KGCEA2 antigen product is a useful tool in cancer diagnosis. Antibodies against this antigen can be used to detect its presence in animal and human patients and in conjunction with eg a toxin these can destroy a KGCEA2 - expressing cell.

Nucleic acid encoding for P40 T-cell growth factor - for patients produced acid encoding for P40 T-cell growth factor - for patients or compromised immune systems, also allows increased produced from the regulation of other cytokine(s).

Claim 1; Fig 15; 122pp; English.

Claim 1; Fig 16; 1
                                                                                                                                                                                      DNA sequences encoding 1,3-fucosyl transferase - used to develop antiinflammatory therapy by inhibition of linking activity.

S Claim 1; Fig 1; 38pp: English.

C The clone was obtd. from CDX pCDM8 clone 7.2 and from a portion of the 7.2 insert subcloned into the sequencing vector pNN11 to prepare pS0219. The sequence encodes protein 7.2, a 1,3-fucosyl transferase a surface glycoprotein which is recognised by anti-CDX antibodies and which binds to ELAM1. The portion of the sequence from nucleotide 9-2162 is identical to the portion of clone 1 (Q14383) from nucleotide 492-2645. The two inserts may represent different transcripts from the same DNA segment. The protein may be useful in the development of anti-inflammatory or other therapies.

The sequence encodes protein 1, a 1,3-fucosyl transferase a surface glycoprotein which is recognised by anti-CDX antibodies and which binds to ELAM1. The portion of the sequence from nucleotide 492-2645 is identical to the portion of clone 7.2 (014382) from nucleotide 9-2162. The two inserts may represent different transcripts from the same DNA segment. The protein may be useful in the development of anti-inflammatory or other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The clone was a factory.

PT Viral genomic DNA complementary to RNA of human leukaemia virus -

PT useful in recombinant DNA producing therapeutic and diagnostic

PT useful in recombinant DNA producing therapeutic and diagnostic

PT proteins

CC Diagnosis of human leukaemia and/or lymphoma and virus infection is

CC made with part or all of the recombinant DNA. Virus antigenic

CC proteins can be produced. These peptides and proteins, and

CC prevention of human leukaemia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       prepared from fetal brain, frontal cortex, bone marrow and liver RNA. The cDNAs were hybridized to immobilized isolated yeast artificial chromosomes from the 4p16.3 region. Following washing at high stringency, cDNA segments that had specifically hybridized were eluted, amplified by PCR and cloned. Clones were mapped back to the YACs. Inserts were sequenced using both standard (T3 and T7) and custom primers. "

/note="cDNA from frontal cortex RNA and from a pool
prepared from fetal brain, frontal cortex, bone marrow and
liver RNA. The cDNAs were hybridized to immobilized
isolated yeast artificial chromosomes from the 4p16.3
region. Following washing at high stringency, cDNA
segments that had specifically hybridized were eluted,
amplified by PCR and cloned. Clones were mapped back to
the YACs. Inserts were sequenced using both standard (T3
and T7) and custom primers. " 7 others

/note="Vector: lambda Zip-Lox; Site_1: Sal; Site_2: Not;
/Lambda PRL2 is a cDNA 11brary derived from equal
quantities of 4 pools of mRNA. The mRNA sources were 1) 7
day germinated eticlated seedlings; 2) tissue culture
grown roots; 3) staged plants half with 24 hour light
cycle, half on 16 hr light, 8 hour dark- rosettes; 4)
same plants as 3 but aerial tissue (stems, flowers and
siliques. The vector is BRL's lambda Zip-Lox. The cDNA
inserts were directionally cloned with Sal-Not arms using
oligo dT primed cDNA.

Enod2a genomic clone.
Enod2; soybean; root nodule; regulatory region; nodulin 75;
Glycine max (L) Merr. cv. Williams.
                                                                                                                                                                                                                                                                                                                                      DNA indicating complement to RNA gene of Human Immunodefictency Virus type 2 used for new vaccine or diagnostic for AIDS virus.

Claim 2; Fig.4; 12pp; Japanese.

cDNA to novel HIV-2 (GH-1) has been integrated into plasmid pDC HIV-2(GH-1). Useful for diagnosis and vaccination against the virus. Carries 7 overlapping genes in varrious reading frames, includding Gag, Pol and Env.

Sequence 9360 BP; 3211 A; 1944 C; 2317 G; 1888 T;
